

NEWS update AUGUST 2017

BRING ON THE SUN!

In keeping with Divall's commitment to sustaining the environment we are in the process of installing an array of solar panels on our workshop and office buildings with the system containing approximately 450 panels & totalling 140 kilowatts. This initial setup has cost \$182,000 and should offer a return on investment within 3-5 years dependant on fluctuations in market power prices.

The system will be producing approximately 230 megawatt hours annually which will save around 216 tonnes of greenhouse gases per year.

The frameless, full glass & triple diode designed panels have a guarantee of 90% efficiency for 25 years allowing Divall's to greatly reduce our impact on the environment for years to come.

The long term vision is to install batteries to capture the solar energy converted which will ensure more of the business will run on renewable energy and further commit to a sustainable future.
